Continuation of 3. NOTE: Incorporation of claim 20 into claim 14 creates new combinations with the dependent claims, therefore, it creates new issues requiring further consideration.

Continuation of 11. does NOT place the application in condition for allowance because: Applicant's arguments are not convincing. Applicant states that the prior art to Rosell (USPN 4,629,026) fails to teach a rack fixedly connected to the cylinder in the axial direction. He indicates that the rack of Rosell can tilt and move axially relative to the cylinder. The examiner disagrees. Rosell specifically states that the rack can tilt relative to the cylinder about the axis of pinion 20 or about an axis parallel to piston rod 14. It also states that the ends of the rack body are "immobilized" by cross members 54. These cross members fix the ends of the rack against axial movement relative to the cylinder. This is clearly the intended arrangement. Some lateral or radial movement is advantageous in that it helps to bias the rack toward the pinion. However, any longitudinal relative movement only takes away from the transmission of steering input to the wheels, thereby interfering with effective steering. No axial relative movement is taught by Rosell. Therefore, Rosell is believed to teach the claimed invention.
